

Juice Extractor

Repo scope: squeeze/

One-page repo summary for the runnable app in squeeze/

WHAT IT IS

Electron desktop app that extracts selected files from a Juice repository with only the dependencies they need. It can manage a Juice clone, analyze imports, and export reproducible zip packages with a manifest.

WHO IT'S FOR

Primary user: developers working with the Juice JS codebase who want slim, rebuildable extracts of selected modules.

WHAT IT DOES

- Connects to an existing local Juice repo or clones a managed copy into AppData.
- Shows repo version and current commit after Git-based sync.
- Browses a searchable repository tree and limits selection to code files.
- Analyzes transitive local dependencies for the selected files before export.
- Exports a zip plus extract-manifest.json for reproducible packaging.
- Can bundle or minify dependencies with esbuild into pulp.mjs / juiced.mjs outputs.
- Can import a prior manifest and rebuild an updated export zip.

HOW IT WORKS

- Main process: squeeze/src/main.js creates the BrowserWindow, manages repo setup, Git sync, dialogs, and IPC handlers.
- Preload bridge: squeeze/src/preload.js exposes a constrained juiceExtractor API to the UI.
- Renderer: squeeze/src/renderer/index.html + renderer.js drive setup, file search, selection, live analysis, export, and manifest rebuild flows.
- Dependency service: squeeze/src/dependency-service.js walks the repo, resolves local imports, computes transitive dependencies, builds bundles with esbuild, and writes zip payloads with archiver.
- Data flow: user selects or clones a repo -> renderer calls IPC -> main process invokes dependency service -> export metadata and zip are returned to the renderer.

HOW TO RUN

1. **cd D:\js-juice\squeeze**
2. **npm install**
3. **npm start**
4. **In the app, choose an existing Juice repo or use Download Managed Copy.**
